

Clipboard Auto Typer v4.1

User Manual - Command Mode Build

This manual explains how to install, run, and use Clipboard Auto Typer v4.1. This build keeps the application version as 4.1.0 but replaces the previous action-letter shortcut chords with a safer Command Mode popup.

Application	Clipboard Auto Typer
Version shown in app	4.1.0
Build note	Command Mode shortcut fix
Primary targets	Microsoft Word and Google Docs / Browser
Main global control	Ctrl + Alt + Insert opens Command Mode popup

Important privacy note: the application itself does not upload clipboard text, does not collect user data, and does not require an online account. Google Docs may sync content through Google as usual because it is a web application.

1. Program Overview

Clipboard Auto Typer monitors copied clipboard text, adds it to an in-memory typing queue, and inserts selected text into Microsoft Word or Google Docs/browser targets. It includes queue control, edit-before-typing, confirmation dialogs, typing profiles, diagnostics, dark mode, log export, and emergency stop.

2. Main Features

Feature	Description
Clipboard queue	Copied text can be added to a queue before typing.
Word exact insertion	Uses Microsoft Word automation for high-fidelity insertion into Word.
Google Docs support	Supports Browser Paste for exact insertion and Browser Human Type hybrid Unicode mode.
Command Mode popup	Press Ctrl + Alt + Insert, then click the desired control button.
Typing profiles	Switch quickly between Word exact, Word natural, Google Docs exact, and Google Docs natural modes.
Safety controls	Includes countdown, confirmation, duplicate protection, and emergency stop.
Offline app behavior	The app itself runs locally; dependency installation and Google Docs may require internet.

3. System Requirements

- Windows 10 or Windows 11.
- Python 3.9 or later if running from source.
- Microsoft Word for Word modes.
- A supported browser for Google Docs/browser modes, including Chrome, Edge, Firefox, Brave, Opera, Vivaldi, SunBrowser, and Chromium-based browsers.
- Internet may be required to install dependencies and to use Google Docs online.

4. Installation

Extract the ZIP file, open the project folder, and double-click `install_dependencies.bat`. This creates a local virtual environment and installs the dependencies listed in `requirements.txt`.

```
install_dependencies.bat
```

If PowerShell blocks script activation, use the batch files or run:

```
Set-ExecutionPolicy -Scope Process -ExecutionPolicy Bypass
```

5. Running the Application

The beginner-friendly method is to double-click `run_app.bat`. To run manually, open PowerShell in the folder that contains `main.py` and run:

```
py -m venv .venv
.venv\Scripts\Activate.ps1
pip install -r requirements.txt
python main.py
```

6. Command Mode Popup

This build no longer uses a second action key after the shortcut. Press `Ctrl + Alt + Insert` once. A small Clipboard Auto Typer - Command Mode popup appears. Then click the button for the action you want.

Button	Action
Start Monitoring	Starts clipboard monitoring.
Stop + Clear Queue	Stops typing/monitoring and clears pending queue items.
Pause / Resume	Pauses or resumes active typing.
Type Selected Queue Item	Types the currently selected queue item.
Type Current Clipboard	Types the current clipboard text.
Show / Hide Main Window	Shows or hides the main app window.
Emergency Stop	Stops typing immediately and clears pending actions.
Close	Closes only the Command Mode popup.

Why this fixes shortcut conflicts: only `Ctrl + Alt + Insert` is global. The app does not wait for S, T, P, Q, H, or E while Word or Google Docs is focused, so those letters are not sent into the document as command keys.

7. Recommended Modes

For Microsoft Word, select Destination: Microsoft Word and Typing method: Safe Insert (Word exact). This is the most reliable Word mode for Unicode, symbols, line breaks, and paragraph spacing.

For Google Docs, select Destination: Google Docs / Browser and Typing method: Browser Paste (Google Docs exact) when exact output is most important. Use Browser Human Type (hybrid Unicode) when you want visible typing with automatic fallback for accents, symbols, and emojis.

8. Basic Workflow

1. Open Word or Google Docs and click where the text should go.
2. Open Clipboard Auto Typer and choose the correct destination and typing method.
3. Click Start Monitoring.
4. Copy text from another source.
5. Select the new queue item and review the preview.
6. Click Type Selected, or press Ctrl + Alt + Insert and click Type Selected Queue Item.
7. During the countdown, click inside the target document if needed.
8. Use Emergency Stop if typing must stop immediately.

9. Test Examples

Use these samples to verify that the typed output matches the clipboard content:

Hello World!
This is a clipboard typing test.

Numbers: 123456789
Symbols: @#\$%^&*()
Special characters: ä ö ü ñ

Paragraph one.

Paragraph two with spacing preserved.

10. Building an EXE

To create a Windows executable, double-click build_exe.bat. The executable will be created in the dist folder.

dist\Clipboard Auto Typer v4.1.exe

To build manually, run:

```
python -m PyInstaller --onefile --windowed --name "Clipboard Auto Typer v4.1" main.py
```

11. Troubleshooting

Problem	Solution
Command Mode does not open	Run the app normally first with <code>python main.py</code> . Make sure the keyboard package installed successfully. If the app is running as a normal user but the active app is running as administrator, run both at the same permission level.
Old shortcuts still happen	Exit all old tray icons and end old <code>python.exe/pythonw.exe/Clipboard Auto Typer.exe</code> processes. Then run only this command-mode build. Rebuild the EXE if using a packaged copy.
Letters still appear in Google Docs	Confirm you are not using an old v4.1 shortcut-fixed build. This command-mode build does not register action letters globally.
Browser not detected	Use Google Docs / Browser mode and make sure the browser window is active. SunBrowser and common Chromium browsers are included.
Accents or emojis are not exact in human mode	Use Browser Paste for maximum exactness, or Browser Human Type hybrid Unicode mode for fallback paste insertion.
PowerShell activation blocked	Use <code>Set-ExecutionPolicy -Scope Process -ExecutionPolicy Bypass</code> for the current terminal, or run the included batch files.

12. Safe Shutdown

Use Stop + Clear Queue or Emergency Stop before closing if typing is in progress. To fully close the app when minimized to tray, right-click the tray icon and choose Exit.
